*1. The I/O refreshing method is automatically set according to the connected communication unit and CPU unit.
*2. The maximum transmission distance for an SSI input unit depends on the baud rate due to the delay that can result from the responsiveness of the connected encoder and cable impedance. The maximum transmission distance is only a guideline. Review the specifications for the cables and encoders in the system and evaluate the operation of the equipment before use.

*1. You can use the external input 0 as a latch input.
*2. You can use the external output 0 as an error counter reset output.
*3. These functions are supported when you also use the MC function module in the NJ-series CPU unit. Refer to the NJ-series CPU unit motion control user's manual (Cat.No. W507) for details. A pulse output unit only outputs pulses during the control period based on commands received at a fixed period. Target position calculations (distribution calculations) for acceleration/deceleration control or for each control period must be performed on the controller that is connected as the host.
*4. The I/O refreshing method is automatically set according to the connected communication unit and CPU unit.

*1. Setting is possible in the unit operation settings of the Sysmac Studio software.
*2. This is the value of the RS signal when the port enters the operational state or immediately after the port is restarted. The initial value is disabled when RS/CS flow control is set. It is also disable for the NX-CIF105.
*3. This setting is provided for communication protocols that assume the end of the data if data is not received for a specific period of time. For example, if the number of characters to determine the end is set to 35, the end of the data will be assumed if data is not received for the time required to receive 3.5 characters.
*4. If the baud rate is set to higher than 19,200 bps, refer to the manual for the remote communications device.
*5. The maximum total cable length for multidrop connections is 1200 m.
*6. The settings that are backed up are saved in memory in the communication coupler unit, not in the communication interface unit.
