Accessories (Order Separately)

[E3S-A General-purpose Sensor Accessories](#)

Name	Model	Remarks
Slit for Through-beam Sensor	E39-S46	2 mm, 1 mm, and 0.5 mm slits are sold in pairs, one each for the receiver and emitter of a through-beam model
Mounting Bracket for Vertical Sensor	E39-L59	Purchase two brackets for each through-beam model
	E39-L81	
Filter for Mutual Interference Prevention (for Through-beam Sensor)	E39-E6	4 filters are sold together for two through-beam models (2 filters each for the emitters and receivers)
Reflector for Optical Axis Adjustment (for Through-beam Sensor)	E39-R5	One only

Plugs (for Sensors with Connector Terminals)

Cord	Appearance		Cord length	Model
Standard	Straight (3 conductor)		2 m	XS2F-D421-DC0-A
			5 m	XS2F-D421-GC0-A
	L-shape (3 conductor)		2 m	XS2F-D422-DC0-A
			5 m	XS2F-D422-GC0-A
Robot (vibration-proof)	Straight (4 conductor)		2 m	XS2F-D421-D80-R
			5 m	XS2F-D421-G80-R

Self-diagnostic Function

With this function, the E3S-A checks changes in environmental conditions (especially a change in the ambient temperature) and self-diagnoses the resistance against the changes. The result is shown by the indicators or an output signal.

Amount of incident light	Green indicator	Indicator	Incident light indicator (red)	Self-diagnostic function	Self-diagnostic example
1.2 or more	Stable operating state with incident light: Stable operation is expected in the rated temperature range with the green indicator ON.	 Green Red	With light incident (red indicator: ON)	---	---
1.0 to 1.2	Conditional operating state with incident light: Stable operation is expected if the temperature fluctuation is within $\pm 10\%$ of the primary temperature.	 Green Red	Without light incident (red indicator: OFF)	The self-diagnostic alarm output alerts the user to this state if it continues for 0.3 s.	The optical axis misaligned by vibration. 
0.8 to 1.0	Stable operating state with no incident light: Stable operation is expected in the rated temperature range with the green indicator ON.	 Green Red			Light decreased by dust. 
0.8 or less	Stable operating state with no incident light: Stable operation is expected in the rated temperature range with the green indicator ON.	 Green Red			With light leakage (through-beam and retroreflective Sensors)  Light reflected from the floor or the background (diffuse reflective Sensors) 

External Diagnostic Input Function

To switch the emission off, short-circuit the pink and the blue cords of the emitter of the E3S-AT or the E3S-AR with the NPN output feature. For the E3S-AT or the E3S-AR with the PNP output feature, short-circuit the pink and the brown cords. With this function, the operating status can be checked before operation.

E3S-AT□/E3S-AR□ Emitter

The sensor is normal if the control output varies when the self-diagnostic external input is ON and OFF. The sensor is abnormal if the control output does not vary when the self-diagnostic external input is turned ON or OFF.

Note: Before using the self-diagnostic external input function, the incident light beam to the sensor must not be blocked by an object.

Timer and Turbo Switch (Sensors with Self-diagnostic Output Function)

The E3S-A Sensor equipped with the self-diagnostic feature incorporates an OFF-delay timer that can be adjusted within a range of 0 to 100 ms.

The emitter of the through-beam sensor with the self-diagnostic feature incorporates a turbo switch. When this switch is on, the intensity of the red LED light source can be increased to

make a brighter spot. The OFF-delay time adjustor of the retroreflective and the 20-cm diffuse reflective sensor is used as a turbo switch. When the adjustor is pressed, it functions as a turbo switch to automatically increase the power of the light source to create a brighter light spot. Do not press the adjustor when turning it

Sensitivity Adjustment (Reflective Sensors)

Item	Position A	Position B	Setting
Sensing condition			---
Sensitivity adjustor			
Indicators	OFF (green) STABILITY (green) ON (red) LIGHT (red)	OFF (green) STABILITY (green) OFF (red) LIGHT (red)	OFF (green) STABILITY (green) ON (red) LIGHT (red)
Procedure	Locate a sensing object at the sensing distance, set the sensitivity adjustor to the minimum scale position, and gradually increase sensitivity by turning the sensitivity adjustor clockwise until the incident light indicator (red LED) is ON. Position A is where the indicator has turned ON. Regard the maximum scale position as Position A if the indicator does not turned ON at full sensitivity.	Remove the sensing object and gradually decrease sensitivity by turning the sensitivity adjustor counterclockwise from the maximum scale position until the incident light indicator (red LED) is OFF. Position B is where the indicator has turned off. Regard the minimum scale position as Position B if the indicator does not turned ON at minimum sensitivity.	Set the sensitivity indicator to the position between Positions A and B (in some cases, Positions A and B are opposite of the above example). The photoelectric sensor will then work normally if the stability indicator (green) is lit with and without the sensing object. If it is not lit, stable operation cannot be expected, in which case a different detection method must be applied.

Unlike conventional photoelectric sensors, the variation in the sensitivity of E3S photoelectric sensors is minimal. This means the sensitivity can be adjusted on only a single photoelectric sensor, and then the adjustors on the other photoelectric sensors can be set to the same scale position. There is no need to adjust the sensitivity of each photoelectric sensor individually.

Turbo Function (Turbo Switch)

With the turbo function switched ON, the light spot is visible even at a distance of 20 cm, making it easy to check the sensing position and the angle of the optical axis.

1. After using the turbo function, readjust the OFF-delay time that had been set, since the OFF-delay time could have been changed when the turbo switch (which is on the OFF-delay time adjustor) was pressed.
2. Press the OFF-delay time adjustor to switch ON the turbo function with a maximum force of 1 kg and within a maximum period of 3 mins. (The photoelectric sensor, however, will not malfunction even if the turbo function is switched on for more than 3 mins.)

With Turbo Switch ON

The turbo function is effective with the turbo switch pressed, and the function is reset automatically when released.

Normal Operating Condition

Operating Mode Selection

As shown in the following illustration, the E3S-A has an operating mode selector on the panel where the Receiver connector is located. With this operating mode selector, the E3S-A is in either dark-ON or light-ON mode.

Straight Type
XS2F-D421-DC0-A

The XS2F-D421 Straight Cable Connector is also available. Refer to the output circuit diagram on page A-237.

Cable drawing direction	No. of conductors	Cord length	Model
Straight	3	2 m	XS2F-D421-DC0-A
	4		XS2F-D421-D80-A
Straight	3	5 m	XS2F-D421-GC0-A
	4		XS2F-D421-G80-A

Attachments

Standard Mounting Bracket
(for E3S-A Horizontal Sensor)
E39-L69

Standard Mounting Bracket
(for E3S-A Vertical Sensor)
E39-L70

Close Mounting Plate (for E3S-A Connector Type)
E39-L60

Sensitivity Adjustor Knob (for E3S-A)
E39-G2

Retroreflector (Included with E3S-□R□□)
E39-R1

Accessories (Order Separately)

Vertical Mounting Bracket (for E3S-A)
E39-L59

Mounting Example of E3S-A on E39-L59

Mounting Example of E3S-A on E39-L81

Slit (for E3S-A) E39-S46

Note: The width of A is 0.5 mm, 1 mm, or 2 mm depending on the model.

Filters for Mutual Interference Prevention (for E3S-A) E39-E6

Note: Two vertical filters and two horizontal filters are sold together.

Mini-reflector E39-R4

Optical Axis Confirmation Reflector
(for E3S-A) E39-R5

Bracket to be attached to the emitter panel of E3S-A

Small Reflector E39-R3

E39-R3 - With Enclosed Mounting Bracket

Reflecting Tape E39-RS1

Reflecting Tape E39-RS2

Reflecting Tape E39-RS3

Item	E39-R3	E39-RS1	E39-RS2	E39-RS3	E39-R4
Directional angle	30° min.			2 to 20°	
Ambient temperature	Operating: -25°C to 55°C Storage: -40°C to 70°C	Operating: -25°C to 55°C Storage: 0°C to 40°C		Operating: -25°C to 55°C Storage: -40°C to 70°C	
Ambient humidity	Operating: 35% to 85% Storage: 35% to 95%	Operating: 35% to 85% Storage: 35% to 85%		Operating: 35% to 85% Storage: 35% to 95%	
Enclosure rating	IP67				

Note: The above reflector tapes are polarizing.

Installation

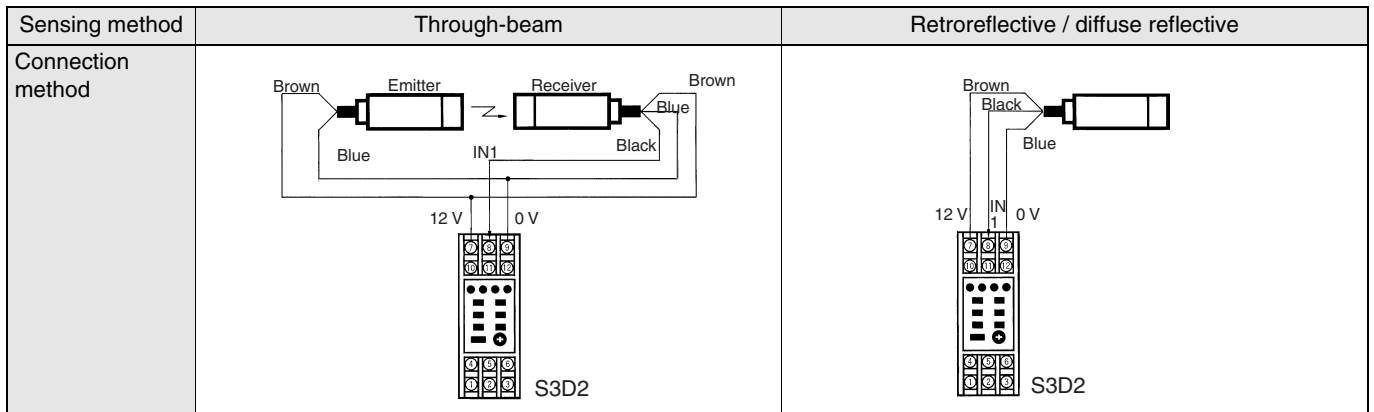

Connections (Without Self-diagnostic Function)

Load (Relay)

- * 10 to 30 V for the E3S-A
- ** If the load is a relay, insert a surge absorbing diode between the coils of the relay.
- *** The connection examples are for sensors with the NPN output.

With Sensor Controller S3D2

Plug (for E3S-A with connector)

Internal Connection

Item	Color of cord	Connection pin No.	Application
For DC	Brown	1	Power supply (+V)
	Black	4	Output
	Blue	3	Power supply (-V)

Note: Pin No. 2 and 4 are connected internally.

External connection

Tightening Plug

Turn part B by hand (do not use a pliers or the plug will be damaged) and tighten it with part C so that length A is nearly zero. Part B must be tightened properly with part C, or otherwise part B could be loosen by vibration and the sensor will not maintain the specified enclosure ratings.

Note: Use the spacer (sold together) to mount the photoelectric sensor with or without the enclosed mounting bracket (refer to Dimensions (page A-244)).

Precautions

The supplied voltage must be within the rated voltage range. Unregulated full-or half-wave rectifiers must not be used as power supplies.

If the input/output lines of the photoelectric sensor are placed in the same conduit or duct as power lines or high-voltage lines, the photoelectric sensor could be induced to malfunction, or even be damaged, by electrical noise. Either separate the wiring, or use shielded lines as input/output lines to the photoelectric sensor.

Do not use a hammer to hit the amplifier when mounting or the amplifier will loose watertightness.

Note the following when using the E39-R3, E39-RSA, or E39-RSB reflector (tape):

1. Before applying adhesive tape to the reflector, make sure that the reflector is free from oil or dust, or otherwise the adhesive tape will not stick to the reflector properly.
2. Do not cut the reflector or the reflector will loose watertightness.
3. Do not press the reflector with a metal object or a nail, or otherwise the reflector will not function properly.

Position of Optical Axis of Through-beam Model

Unlike conventional through-beam models, the E3S Through-beam Photoelectric Sensor incorporates 2 lenses. But the lens actually in use is the one marked with an arrow indicating the position of the optical axis. When using a slit, attach it to the lens marked with the arrow.

Position of Arrow Indicating Optical Axis

Model	Position of lens in use
E3S-A (vertical)	Top
E3S-A (horizontal)	Bottom

Adjustor Cap

In order to prevent the sensitivity or OFF-delay time that has been set from changing accidentally enclosed, cover the adjustors with the adjustor cap (enclosed).

Mutual Interference Filter (E39-E6/-E8)

A set of 4 filters are sold together for two through-beam models (for 2 each of emitters and receivers).

For mounting, refer to the figure of the slit for the E3S-A Photoelectric Sensor.

The arrow printed on the cover indicates the direction of polarization. By attaching the filters opposite to each other in polarization to the emitters and the receivers (refer to the figure) in rows, mutual interference can be prevented (in any case, the filter attached to an emitter and to the corresponding receiver must be the same in direction of polarization or the photoelectric sensor will not function).

Mounting Bracket

The direction of the optical axis coincides with the mounting direction of the E3S when the mounting screw is inserted into the lock hole of the mounting bracket. Unlike conventional photoelectric sensors, if the sensing object (or the retroreflector in the case of a through-beam sensor) is in the mounting direction of the photoelectric sensor, the object is detected with the incident light without the time-consuming adjustment of the optical axis (but if the mounting surface is not flat, the adjustment of the optical axis may still be required).

Note: The maximum tightening torque applied to the screw is 5.5 kgf x cm (0.53 N x m).

Installation of Accessories

Sensitivity Adjustor Knob (Attachment)

To temporarily use the knob to adjust the sensitivity of the photoelectric sensor, insert side A into the shaft of the sensitivity adjustor.

To permanently use the knob to adjust the sensitivity of the photoelectric sensor, insert side B into the shaft (the knob cannot be removed if once side B is inserted into the shaft).

Slit (E39-S46 Order Separately) for E3S-A

Use the rubber attachment with the metal cover if a slit width of 2 mm is required. Insert the 0.5- or 1-mm slit between the metal cover and rubber attachment if a slit width of 0.5 or 1 mm is desired. These slits fit into the rubber attachment.

Note: Apply the slit to the lens of the photoelectric sensor marked with an arrow indicating the position of the optical axis (apply it to the bottom lens of horizontal sensors and the top lens of vertical sensors).

Optical Axis Reflector (E39-R5 Order Separately)

Use this attachment when the set distance is long and adjustment is mechanically difficult with a sensing object.

Attach the reflector to the receiver (refer to the figure). Look at the reflector from right behind the emitter. The reflector should be bright with red light when the optical beam strikes the reflector. If the emitter has a turbo function, the reflector looks brighter with the function switched on. When the reflector is removed, the light beam strikes the receiver.

ALL DIMENSIONS SHOWN ARE IN MILLIMETERS.

To convert millimeters into inches, multiply by 0.03937. To convert grams into ounces, multiply by 0.03527.
